No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Trochta O.A., Jacobs R.M., Lamarre J.;

"The role bFGF in canine Hemangiosarcoma.";

Ru Submitted (APR-1998) to the EMBL/GenBank/DDBJ databases.

"Left runction: Wide-Spectrum Mitogenic, angiogenic, and neurotrophic factor. Implicated in a multifude of physiologic, and pathologic factor. Implicated in a multifude of physiologic, and pathologic processes, including limb development, angiogenesis, wound healing, and tumber growth. Potent Mitogen and Chemoattractant for mesenchyme-derived cells. Implicated in the Differentiation, complete and in bone formation. Major angiogenic factor that also system and in bone formation. Major angiogenic factor that also activates tumor neovascularization (BY SIMILARITY).

C. SUBUNIT: FORMS A QUATERNARY COMPLEX WITH TWO FGFR1 AND AT LEAST ONE HEPARAN SULFATE (BY SIMILARITY).

The HEPARAN SULFATE (BY SIMILARITY).

The HEPARAN SULFATE (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

From mRNA from human foreskin derived primary culture cell. It can be used to produce recombinant hbFGF for prodn. of MAbs specific for bFGF (do not cross react with acidic FGF). High purity bFGF is also useful for promoting healing of burns and wounds and, due to its neovascularising action, to treat thrombosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ното
  Claim
                                    Derived basic fibroblast growth factor - for treating ulcers, regenerating damaged neural tissue, aiding tissue transplant bone graft and revascularising ischaemic tissue
                                                                                                                                                                                                                                                                                   09-JAN-1991;

Cys 69 and Cys 87) derivatised with an agent able to form a covalen s-C bond with Cys. Typical agents include iodoacetic acid, haloacetamide, alkali tetrathionates, alkyl methanethiosulphonates and 1-6C alkylsulphones. The derivatised bFGF is used to accelerat the healing of wounds (including burns, ulcers, transplants, and bone grafts), to revascularise ischaemic tissue or to regenerate damaged neural tissue. Compared with native bFGF the recombinant derivatised bFGF has better biological activity and stability (esp. not aggragating by dimer formation) and is also easier to isolate.
                                                                                                       Novel unit dose comprising fibroblast growth factor, its angiogenically active fragment or mutein for inducing cardiac angiogenesis, treating coronary artery disease and reducing post myocardial infarction injury
                                                                                                                                                                                                                    (CHIR )

equence of 140 ((II) and (II: (VII), 207 ((VIII) and (XI)),

is invention describes a novel unit dose (I), of fibroblast growth into (FGF) comprising 0.008-6.1 mg of a mammalian FGF comprising guence of 140 ((II) and (III)), 146 ((IV) and (V)), 205 (VI), 266 (VI), 205 (VI), 205 (VII) and (VII)), 207 ((VIII) and (XI)), 215 (IX), and 208 (X) amino acids (aa),

The product of the invention has angiogenic and cardiant activity. (I) is used for treating a human patient for coronary artery disease, and inducing angiogenesis in the human heart. (I) further provides an adjunct for reducing post myocardial infarction injury in humans. The unit dose provides the human patient with a rapid and therapeutic cardiac angiogenesis sufficient to obviate surgical intervention and results in an superior increase in the treated patients's exercise tolerance time (ETT). It also provides a safe and therapeutically efficacious treatment for the patients with coronary artery disease that lasts at least 6 months before a further treatment is needed. The method provides superior increase of 1.5-2 minutes in the treated patient's (ETT), compared to an increase of 30 seconds for current modes treatment. This sequence represents the human FGF-2 protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for treating or preventing erectile dysfunction, comprising administering a fibroblast growth factor (FGF), epidermal growth factor (FGF), platelet derived growth factor (PDGF), vascular endothelial growth factor (VEGF) or tissue growth factor (FDGF). The invention is used to treat or prevent erectile
                             The present invention describes a method of preventing or treating neuronal damage following a central nervous system insult, involving modulating the cerebral temperature and administering a neurologic therapeutic agent. The agent may be a growth factor, such as fibrobly growth factor (FGF) or insulin-like growth factor (IGF). The method particularly uggful in the treatment of ischaemia cerebrovascular disease. The present sequence is the human basic IGF protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protein.

                                                                                                                                           The invention relates to pharmaceutical composition comprising stabilised fibroblast growth factor (FGF) or its variant. Methods for increasing storage stability of FGF or its variant in a liquid or lyophilised composition is also provided. The method is useful for increasing storage stability of a pharmaceutical composition comprising FGF or its variant which becomes oxidised during storage. The pharmaceutical composition is useful for promoting tissue regeneration, treating wounds, ischaemic heart diseases, stroke and is used for bone fracture healing. The present sequence is human FGF-2 partial protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human;
